Steve2412

Summary

Software Engineer with a strong background in software development, database management, and project coordination. Passionate about technological innovation, with experience in analyzing, designing, and implementing solutions that streamline business processes and enhance operational efficiency.

Education

BS **Universidad Rafael Belloso Chacín**, Software Engineering — Maracaibo, Zulia, Venezuela
Jan 2020 – July 2024

- Database analysis, design, and management
- Structured and object-oriented programming
- Web application development
- Software engineering (requirements analysis, design, testing, and maintenance)
- Fundamentals of artificial intelligence
- Software quality assurance and evaluation
- Technology project management
- Information systems auditing and evaluation

Experience

Ticvenca, College Intern — Maracaibo, Zulia, Venezuela
Apr 2024 – July 2024
4 months

Developed a vehicle sales management system during my academic internship, applying software analysis, design, and implementation methodologies to optimize business processes.

- Designed UML diagrams to model system architecture
- Built and managed the SQL Server database
- Developed user interfaces using Visual Studio
- Implemented system functionalities with C#
- Integrated libraries for automated PDF generation
- Documented technical processes for future developers

Projects

CambiApp — June 2026

Currency calculator for Venezuela providing real-time USD BCV, EUR BCV, and USDT P2P rates.Built with Kotlin + Jetpack Compose + Material 3 + Clean Architecture.

- Real-time Rates: Fetches up-to-date data from BCV and Binance.
- Fallback System: If the primary API fails, it performs direct scraping from the BCV website to ensure availability.
- Offline Cache: Access the latest saved rates via Room Database.
- Home Screen Widget: View rates quickly from your launcher using Jetpack Glance.
- Automatic Refresh: Background synchronization every 2 hours via WorkManager.
- Modern UI: Clean, minimalist design with Dark Mode support.
- The app is made open-source on GitHub

Conavenca Package Delivery Website Jan 2023 – Jan 2024

This is a comprehensive web application designed for Conavenca, a package delivery agency, built using HTML, CSS, JavaScript, PHP, and Bootstrap. It utilizes a MySQL database for efficient data management.

- Package management: Administers all aspects of package handling, from creation to delivery
- Real-time package tracking: Provides real-time tracking of packages with map integration
- Database backup: Allows administrators to create database backups
- PDF invoice generation: Creates PDF invoices for each delivery
- QR code generation: Generates QR codes for packages to streamline tracking
- The app is made open-source on GitHub

Corblaserca - Online Language Study Platform Jan 2023 – Jan 2023

This is a demo version of a web platform designed for online language learning, built using HTML, CSS, JavaScript, PHP, and Bootstrap. It utilizes a MySQL database for efficient data management.

- Course management: Administrators can register and manage language courses
- Course forum: Space for users to send messages and collaborate within each course
- Payment management: Functionality to report and manage payments made by users
- PDF reports: Generates reports in PDF format using the DomPDF library
- Database backup: Generates a SQL backup file to preserve all the data
- The app is made open-source on GitHub

ICar_Play Inventory Management Website Jan 2023 – Jan 2023

ICar_Play is a web application designed to manage the inventory of vehicles and spare parts, along with client and mechanic information. Built using HTML, CSS, JavaScript, PHP, and Bootstrap, it uses a MySQL database for efficient data storage and retrieval.

- Vehicle inventory manages detailed records that include images, make, model, type, year, and vehicle classification
- Mechanic management maintains records of mechanics and the tasks assigned to each one
- Mechanic management maintains records of mechanics and the tasks assigned to each one
- PDF report generation produces structured reports in PDF format using the DomPDF library
- QR code generation creates QR codes with PHP QR Code to provide quick access to vehicle and spare part information
- The app is made open-source on GitHub

OCR Mobile Application Jan 2023 – Jan 2023

This is a mobile application developed in Kotlin using Android Studio, designed to perform Optical Character Recognition (OCR). The app allows users to either take a photo or choose an image from their gallery, transforming the text present in the image into plain text.

- Image capture allows users to take photos directly using their device's camera
- Gallery selection provides the option to choose images from the device gallery for text extraction
- Text recognition identifies and converts text found in images into editable plain text format
- User-friendly interface features an intuitive design that enables easy and seamless navigation throughout the app
- The app is made open-source on GitHub

Currency Converter Application Jan 2022 – Jan 2022

This application is a currency converter developed in Python, utilizing the Alpha Vantage API for real-time currency exchange rates and the Tkinter library for the graphical user interface.

- Amount input allows users to enter a value in a selected currency
- Real-time conversion converts the entered amount into all available currencies worldwide using up-to-date exchange rates provided by the Alpha Vantage API
- User-friendly interface is built with Tkinter, offering an intuitive and easy-to-navigate graphical environment for effortless currency conversion
- Continuous updates ensure exchange rates are refreshed in real time, maintaining accuracy and reliability for users
- The app is made open-source on GitHub

Skills

Programming & Development:

- Full Stack Frontend web development focused on React, HTML5, CSS3, and JavaScript.
- Extensive Backend experience with PHP, Node.js, Python, and C#.
- Relational database management using MySQL and SQL Server.
- Version control and source management with Git and GitHub.
- Advanced AI tools integration and implementation, such as Claude Code, to optimize software development workflows.
- Software modeling and architecture through the creation and analysis of UML diagrams (use cases, class, sequence, and ER diagrams).
- Planning and execution of software testing (unit, integration, and functional testing) to ensure code quality, stability, and proper operation.
- Implementation of cybersecurity best practices, including secure authentication, sensitive data encryption, and protection against common web vulnerabilities.

English:

"B2 Level (Upper-Intermediate). Fluent ability to understand technical documentation, write reports, communicate effectively, and participate in business meetings."

Italian:

"A1 Level (Beginner). Knowledge of basic concepts, everyday expressions, and elementary vocabulary."
